

Building and Implementing a Risk Assessment Methodology

Are you having trouble getting your Risk Assessment Program off the ground? Don't know where to start? Started it once but came in too hard and slowed the whole process to a grinding halt? Don't have enough resources to assess all systems, applications, tools, vendors, and offshore partners? Treadstone 71 can build a program for you with soft gates yet in-depth that is risk-based. Ensure data classification and roles - responsibilities are part of your process. Devise an ala carte menu of protection strategies and safeguards providing enough choice for the business to remediate strategic and operational risk.

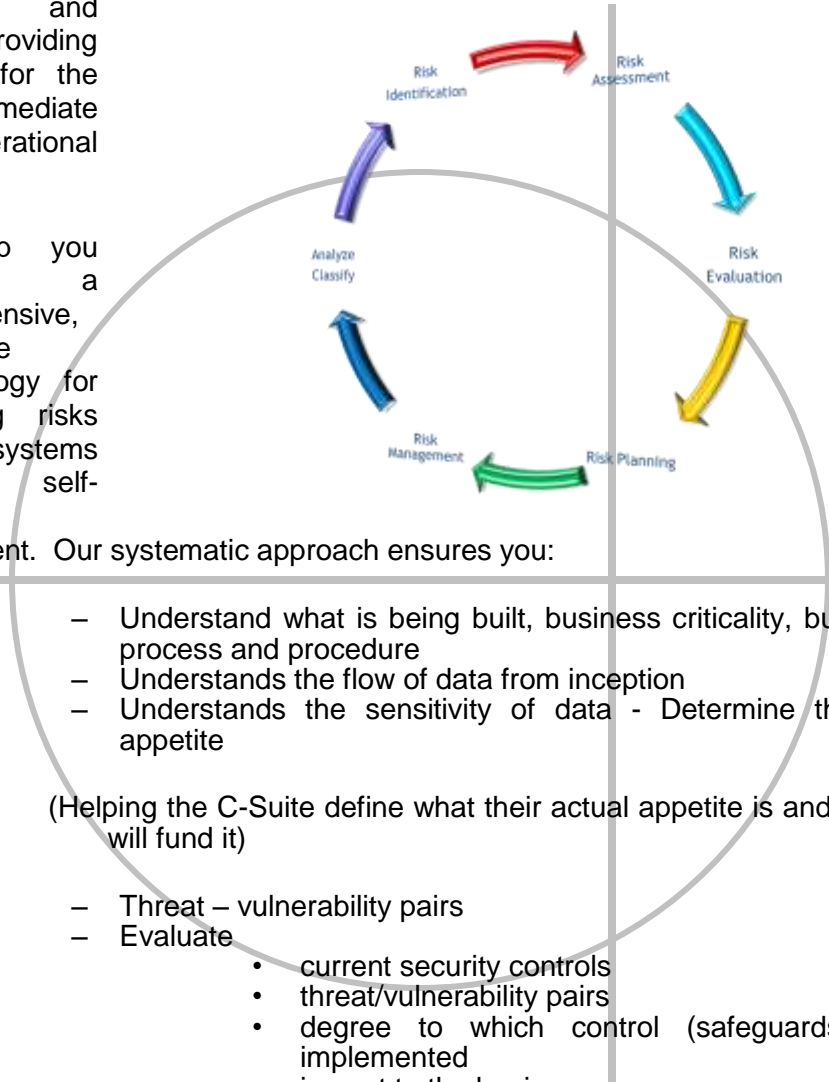

We help you build a comprehensive, repeatable methodology for identifying risks in systems through self-

assessment. Our systematic approach ensures you:

- Understand what is being built, business criticality, business process and procedure
- Understands the flow of data from inception
- Understands the sensitivity of data - Determine the risk appetite

(Helping the C-Suite define what their actual appetite is and if they will fund it)

- Threat – vulnerability pairs
- Evaluate
 - current security controls
 - threat/vulnerability pairs
 - degree to which control (safeguards) are implemented
 - impact to the business
 - resulting risks levels

Treadstone 71 applies risk management to secure existing information infrastructure and to protect critical information assets. Contact us now to get your program started.
